DETAILED ACTION

Allowable Subject Matter

1. Claims 1-5 are allowed.

The following is an examiner's statement of reasons for allowance: Claims 1-5 are allowed since certain key features of the claimed invention are not taught or fairly suggested by prior art. **In claims 1-2 and 4**, “wherein the pair of parallel connections in opposite corners (on diagonal lines) to attain matching voltages shall fulfill the conditions: measured voltages from first corner connections of sensor lines are high, and measured voltages from second corner connections of sensor lines are low, whereby the first and second corner connections respectively exist in diagonal opposite corners of the touch screen panel, and voltage levels at corner points are defined relative to other corner points on one sensor line, not from comparison of two sensor lines”. The closest prior art **Nathan** (6,630,896 B1) teaches a varying references voltage to a first plane of a touch screen with a time of application duration being substantially less than a touch period and by measuring voltage present on a second plane during a portion of the application duration of the voltage to the first plane, Heiser (5,818,4309) teaches measuring a voltage of the second substrate when the first reference voltage is applied across the resistance strip of the first substrate, however, singularly or in combination with other prior art, fail to anticipate or render the above underlined limitations obvious.

2. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Gillespie et al. (6,380,931 B1) teaches sending X and Y position information and detecting a presence of a conductive object on the touch sensor.

Abileah (2003/0222857 A1) teaches a reflection resistant touch screens.

Ahn et al. (2002/0090798 a1) teaches the a contact structure of a touch panel having X-axis (Y-axis) potential compensating electrodes arranged along peripheries of the conductive film of a substrate and bonding together the substrate for reading an X coordinate.
